                                                                                                                                                                           cc polynucleotide from which a polypeptide is producible to confer a confer a confer a polypeptide. The method comparises: (a) selecting a first codon of the parent polynucleotide that encodes the comparise codon is selecting a first codon of the parent polynucleotide for replacement with a synonymous codon, where cc the synonymous codon is selected on the basis that it exhibits a cc different phenotypic preference than the first codon in a comparison of cc different phenotypic preference than the first codon in a comparison of corganism are selected from organisms or parts, where the test corganism are selected from organisms of the same species as the organism cf interest; (and (b) replacing the first codon with the synonymous codon to construct the synthetic polynucleotide. Also described: (1) a method for contenting the phenotypic preference of a first codon in an organism of the method above; (3) an organism or interest or part containing a corganism or interest or the test containing a corganism or interest or part containing a corganism or interest or restricted from the method above; (4) an organism or interest or part that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                뭐

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       888888888888888888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC of a selected phenotype that is displayed by an organism of interest or CC part and that results from the expression of a parent polynucleotide that CC encodes the polypeptide; (6) a method of enhancing the quality of a CC selected phenotype that is displayed by an organism of interest or part CC encodes the polypeptide; and (7) a method of reducing the quality of a CC selected phenotype that is displayed by an organism of interest or part CC encodes the polypeptide; and (7) a method of reducing the quality of a CC selected phenotype that is displayed by an organism of interest or part CC end that results from the expression of a parent polynucleotide that CC encodes the polypeptide. The method is useful for constructing a CC synthetic phenotype to an organism of interest or part in a different CC quality than that conferred by a parent polynucleotide that encodes the golypeptide. It is useful for modulating the quality of a selected confered by an organism or part. The present sequence encodes constructed that confered by an organism or part. The present sequence encodes or part the present sequence encodes the polypeptide. It is useful for modulating the quality of a selected confered by an organism or part. The present sequence encodes the polypeptide. It is useful for modulating the quality of a selected confered by an organism or part. The present sequence encodes the polypeptide is the present sequence, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The present invention describes a method for constructing a synthetic polymucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polymucleotide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of the parent polymucleotide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a different phenotypic preferences than the first codon in a comparison of phenotypic preferences in test organisms or parts, where the test organism are selected from organisms of the same species as the organism

codon, where

P-PSDB;

AD026611.

Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide

Example 1, SEQ ID NO 31; 86pp; English.

The method is useful for constructing a CC synthetic polynucleotide from which a polypeptide is producible to confer cC quality than that conferred by a parent polynucleotide that encodes the polypeptide. The method is useful for constructing a cCC same polypeptide, It is useful for modulating the quality of a selected phenotype displayed by an organism of interest or part in a different cCC invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC different phenotypic preference than the first codon in a comparison of corganism are selected from organisms of the same species as the organism co organisms of the same species as the organism co finterest; and organisms that are related to the organisms of interest; cand (b) replacing the first codon with the synonymous codon to construct the synthetic polynucleotide. Also described: (1) a method for construct the synthetic polynucleotide. Also described: (1) a method for construct the synthetic polynucleotide constructed from the method above; (3) an organism or interest or part containing a corganism or interest or part containing a synthetic construct that comparises a regulatory polynucleotide operably linked to a tandem repeat of a first codon fused in frame with a reporter polynucleotide that comparises a regulatory polynucleotide operably linked to a tandem repeat of a first codon fused in frame with a reporter polynucleotide that constructed phenotype in the organism or part; (5) a method of modulating the quality of a selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that cencodes the polypeptide; (6) a method of reducing the quality of a selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that cencodes the polypeptide; (6) a method of reducing the quality of a selected phenotype to an organism of a parent polynucleotide that cencodes the polypeptide. The method is useful for constructing a selected phenotype to an organism of interest or part in a different cencodes the polypeptide. The method is useful for constructing a selected phenotype to an organism of interest or part in a different cencodes the polypeptide. It is useful for modulating the quality of a selected phenotype to an organism or part. The present sequence encodes the polypeptide. It is useful for modulating the quality of a selected phenotype to an organism or p

The present invention relates to a method for identifying a subject at crisk of breast cancer. The method comprising detecting the presence or comprise of one or more polymorphic variations associated with breast cacer in a nucleic acid sample from a subject. The nucleic acid sample comprises the DLG1 region (AD079402) KIRA0783 region (AD079403), DPF3 region (AD079404) or CENPC1 region (AD079405). The gene DLG1 (discs, CC large homolog 1 (Drosophila)) is also known as synapse-associated protein ce gene KIRA0783 is also known as synapse-associated protein ce gene KIRA0783 is also known as PHF14 and PHD finger protein 14. KIRA0783 ce has been mapped to chromosomal position 7p21.3. The KIRA0783 protein is a novel gene with unknown function, however, being a zinc finger protein, ci likely to be a transcription factor. The gene DF3 (D4, zinc and CC double PHD fingers, family 3) is also known as CERD4, cer-d4, FLJ14079 and 2810403803Rik. DPF3 is a Rho family guanine-nucleotide exchange factor. DPF3 has been mapped to chromosomal position 14q24.3-q31.1. The CEMPCI (centromere protein C1) is also known as CERD4, cer-d4, FLJ14079 autoantigen C1. CENPCI has been mapped to chromosomal position 4q12-q31.3. CENPC1 is a centromere autoantigen and a component of the inner CC kinetochore size and a timely transition to anaphase. The method is useful for identifying a subject at risk of breast cancer, for early CC diagnosis, prevention and treatment of breast cancer, to analyze and cCC predict a response to a breast cancer treatment, and in clinical drug trials. The present sequence was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                             S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                       RESULT 1420
                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method of treating bone morphogenic protein (BMP) related disorder or condition. The method involves administering a BMP antagonist to a subject suffering from a BMP-related disorder, blocking biological activity of a BMP or inhibiting the progress of a BMP-related disorder or condition. The BMP-related disorder or condition is a heterotopic cranial synostosis (HO), fibrodysplasia ossificans progressiva (FOP), or sclerostosis. The present sequence is mouse noggin DMA specific PCR primer. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of a bone morphogenic protein (BMP) related disorder or condition, blocking subject, or inhibiting the progress of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                     Detection; polymorphism; perfect compound simple sequence repeat; adaptor directed primer; genome; genetic; fingerprinting; amplified fragment length polymorphism assay; microsatellite region; genetic trait marking; germplasm comparisons; compound; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Compound simple sequence repeat primer (CT) 7.5 (AT) 2.

Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a compound SSR primer. The method represents a modified amplified fragment length polymorphism

                                                                                                                                                    CC Oligonucleotides AAX52276-532 represent PCR primers and probes used to CC isolate and amplify cDNA encoding secreted and transmembrane human CC proteins (see AAX52213-74 and AAY13344-403). The cDNA sequences are CC obtained from cDNA libraries, prepared from fetal lung, fetal kidney, CC fetal brain, fetal liver and fetal retina. The encoded polypeptides have CC specific uses based on their homology to known polypeptides, e.g. PRO211 CC and pRO217 can be used for disorders associated with the preservation and CC chronic mucosal lesions (e.g. enterocolitis, Zollinger-Ellison syndrome, CC gastrointestinal ulceration and congenital microvillus atrophy), skin CC diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis, epithelial cancers such as lung squamous cell carcinoma of the CC vulva and gliomas), potent effects on cell growth and development, CC diseases related to growth or survival of nerve cells including CC earkinson's disease, Albheimer's disease, ALS, neuropathies or cancer. CC PRO265 can be used as for fibromodulin, e.g. for reducing dermal CC scarring, PRO204 can be used as a target for anti-tumor drugs. PRO533 may be used in the treatment of Usher Syndrome or Atrophia areata; PRO269 can be used for treating problems of the kidney, uterus, endometrium, CC can be used for treating problems of the kidney, uterus, endometrium, CC blood vessels, or related tissue, e.g. in the heart of genital tract can be used for related tissue, e.g. in the heart of genital tract

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an isolated polynucleotide encoding a stromal cell derived factor-1 (SDP-1) variant (I) designated SDP1-3'A. SDP-1 variant (I) is useful for determining the prognosis of a subject exposed to HIV-1; and determining the susceptibility of a subject to HIV infection. It is useful for prevention of HIV infection, and for treatment of a subject at risk of or having an HIV infection or disorder, and for treatment of disorders associated with expression of CXCR4. It is useful for patients suffering from AIDS or ARC. The present sequence represents a PCR primer for SDP1-3'A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFE7A, or a humanised version of HFE7A containing identical CDRs (complementarity determining regions) to antibody HFE7A. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. The present sequence represents a humanised HFE7A-derived anti-Fas antibody heavy chain sequencing primer used in an exemplification of the invention. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                     Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; attopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; heavy chain; sequencing primer; ss.

The anti-Pas antibody is either the murine anti-human Fas monoclonal antibody HFE7A, or a humanised version of HFE7A containing identical CDRs (complementarity determining regions) to antibody HFE7A. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. The present sequence represents a humanised HFE7A-derived anti-Fas antibody heavy chain sequencing primer used in an exemplification of the invention. (Updated on 15-SEP-2003 to standardise OS field)
The invention provides a DNA molecule comprising a sequence of nucleotides encoding an alphalf-subunit of a mammalian retinal channel (RCC), including a human alphalf-subunit, a murine alphaunit and orthologs of the human and murine alphalf-subunits
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Retinal calcium channel; RCC gene; alphaif-subunit; retinal disorder; myopia; nystagmus; strabismus; calcium-regulated development pathway; eye disorder; human; CACNAIF; CSNB; mutational analysis; PCR primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preventive or treating agent for the diseases caused by an abnormality the Pas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas antibody.
                                                                                                                                                                                                 New isolated mammalian retinal calcium channel gene, used to develop products for the diagnosis and treatment of incomplete congenital stationary night blindness and related disorders.
                                                                                                                                                  Disclosure;

                                                                              gene may be used to develop products for diagnostic tests, for incomplete CSMB and risk assessment in affected families. The RCC gene can provide information as to the basic defect in this retinal conditions, which could lead to effective methods for treatment or cure of the disorder. As the associated features of myopia, nystagmus and strabismus frequently observed in patients with incomplete CSMB may be caused by calcium-regulated development pathways, identification of the RCC gene may help to elucidate the molecular details of eye development and which may lead to treatment for related eye disorders or diseases. Sequences AAZ46563-650 represent human CACNAIF (alphalF-subunit of RCC gene) exon-specific
Sequence 19

New humanized anti-Pas antibody, useful for treating or preventing inflammatory or autoimmune disease, induces apoptosis selectively Serizawa N, 30-SEP-1998; 29-SEP-1999; Synthetic. 2000-258930/23. SANKYO Haruyama H, S 98JP-00276881. 98JP-00276882. 99EP-00307711. Nakahara K, Tamaki I, Takahashi

Example reference 15; Page 139; 263pp; English

inflammatory or autoimmune disease, cells with abnormal Fas-Fas ligand

systems.

ligand sys This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between antibody-like

RCC

```
CC immunomodulatory, dermatch ogical, immunosupressive, thyromimetic, cardiant and hepatropic activity. (I) induce capoptosis by binding to cell surface Pas or inhibit it by competitive cinhibition of ligand binding. (I) are used to treat and/or prevent cc diseases associated with the Pas/Fas ligand system, especially systemic cc uses erythematosus, Hashimoto disease, rheumatoid arthritis, graft cc versus host disease, Sjorgen's syndrome, pernicious or hypoplastic cc anemia, Addison's disease, scleroderma, Goodpasture syndrome, conhibit agravis, cc disease, autoimmune hemolytic anemia, sterility, myasthemia gravis, cd disease, autoimmune hemolytic anemia, sterility, myasthemia gravis, cc dependent diabetes mellitus, allergy, arrerioselerosis, myocarditis, cc ardiamyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral cc (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Pas, so can be evaluated in cells. They bind to both human and murine Pas, so can be evaluated in cells. They bind to both human and murine Pas, so can be evaluated in commerciang antibody response. This sequence represents converted heavy chain which is used in the method described in the construction of a humanised anti-Pas antibody HFE7A cc invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 1429
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New humanized anti-Pas antibody, useful for treating or preventing e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Example reference 15; Page 139; 263pp; English

CC antirheumatic, nephrotropic, antiinfertility, neuroprotective,
CC antiarteriosclerotic, cardiant and hepatropic activity. (1) induce
CC apoptosis by binding to cell surface Fas or inhibit it by competitive
CC inhibition of ligand binding. (1) are used to treat and/or prevent
CC diseases associated with the Fas/Fas ligand system, especially systemic
CC versus host disease, Sjorgen's syndrome, pernicious or hypoplastic
CC versus host disease, Scleroderma, Goodpasture syndrome, Crohn's
CC disease, autoimmune hemolytic anemia, sterility, myasthenia gravis,
CC disease, autoimmune hemolytic anemia, sterility, myasthenia gravis,
CC disease, autoimmune hemolytic anemia, sterility, myasthenia gravis,
CC dependent diabetes mallitus, allergy, arteriosclerosis, myocarditis,
CC cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral
CC (B, C or D) or alcoholic), and transplant rejection. (1) selectively
CC inhibit apoptosis in normal cells but selectively induce it in abnormal
CC cells. They bind to both human and murine Fas, so can be evaluated in
CC curing a human anti-murine antibody response. This sequence represents
CC primer used in the construction of a humanised anti-Fas antibody HFE7A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of a forward PCR primer that was used in the identification of cDNA clone DNA30487-1231 (see AAA49722), which encodes human antitumour protein PRO328 (see AAY95343). cDNA from a human foetal kidney library was used as template for PCR amplification. A claimed method for inhibiting the growth of a tumour cell comprises exposing the tumor cell to PRO179, PRO307, PRO320, PRO219, PRO219, PRO221, PRO224, PRO328, PRO301, PRO326, PRO362, PRO362, PRO356, PRO59 or PRO866 (see AAY95337-49). The tumour is especially breast, ovarian, renal, colorectal, uterine, prostate, lung, bladder or central nervous system cancer, melanoma or leukaemia. Nucleic acids encoding PRO179 etc. are used in the recombinant production of antitumour polypeptides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The polypeptides and polynucleotides of the invention may be useful as research tools and as therapeutics for treating enterocolitis, Zollinger-Ellison syndrome, gastrointestinal ulceration, psoriasis, cancer, Parkinson's disease, Alzheimer's disease, ALS, neuropathies, dermal scarring and wound healing, nerve repair, thrombosis, bone and/or cartilage formation, angiogenesis, asthma, rheumatoid arthritis, multiple sclerosis, inflammatory disorders, atheroselerosis, cardiac injury, infertility, premature aging, AIDS, diabetes complications and stroke. The molecules may also be utilised during gene therapy procedures and transgenic animal production. The current sequence is that of the PCR primer of the invention which was used to analyse the human PRO DNA of the invention.

The PRO polypeptides are useful for treating skin diseases (e.g. psoriasis), cancers (e.g. lung squamous cell carcinoma), gastrointestinal disorders (e.g. enterocolitis), neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's disease), wound repair, cardiovascular disorders (e.g. endometrial bleeding angiogenesis, ischaemias such as coronary ischaemia, atherosclerosis), inflammatory disorders (e.g. sethma, rheumatoid arthritis, multiple sclerosis), infertility, AIDS and disabetes and retinal disorders manufactular pligmentosum. The PRO nucleic acids have applications in molecular pilony, including use as hybridization probes, and in chromosome and

These CmYLCV DNA molecules confers constitutive expression of associated polynucleotide sequences. The invention also relates to recombinant DNA sequences containing promoter sequences which are used for creating transgenic plants expressing DNA of interest at all times and in most tissues and organs. The present DNA sequence is a PCR primer which is used for amplifying beta-glucuronidase (GUS) reporter gene. GUS reporter gene is used for the construction of plasmids for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 19 BP; 4 A; 8 C; 4 G; 3 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is one of a number of primers used in a method for Cd detecting a mutation or a polymorphism in the human ATM gene, which is associated with the disease ataxia telangiectasia, or a polyexonic cultaryctic gene of at least 4 kb. The method uses an improved version of allows electrophoreais of two or three amplified segments in a single cultaryctic genes such as the ATM gene amplified segments in a single cultaryctic genes such as the ATM gene for mutations and polymorphisms. The new mutations and polymorphisms in the ATM gene are useful for performing more accurate screening of human DNA samples for mutations, for distinguishing mutations from polymorphisms, and for improving the efficiency of automated screening methods. The mega-SSCP method provides a screening method of genes for multiple polymorphisms and mutations at conce. The method is particularly suitable for large, polyexonic, eukaryctic genes, having mutations and polymorphisms at many points and not merely at one or a few hot sports. Note: the SEQ ID assigned to this sequence in the disclosure and claims of the the specification is one number lower than the number given in the sequence listing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Best Local Similarity

```

The present invention which encode proteins

describes polynucleotide sequences of having increased expression in kidney

rat origin

New isolated nucleic acid for producing a PRO polypeptide, genetic disorders and treating cardiovascular, endothelial disorders, such as atherosclerosis, wounds or cancer.

analyzing or angiog

angiogenic

WPI; 2001-090793/10.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            glomerular nephritis-associated polynucleotide and protein sequence have nephrotropic activity. The polynucleotides can be used in the diagnosis, treatment and prevention of kidney disease, especially of proliferative glomerular nephritis, and in the repair of tissues damaged by kidney disease. ABA77002 to ABA77154 and AAG68138 to AAG68147 represent sequences given in the exemplification of the present invention

CC comprising a PRO protein, agonists or antagonists of a PRO protein.
CC compounds which inhibit the expression of a PRO gene. The invention
CC additionally encompasses methods of identifying modulators of PRO
CC expression or activity; diagnosing a cardiovascular, endothelial or
CC anglogenic disorder, or a susceptibility to such a disorder by detecting
CC mutations in a PRO gene, or the expression level of a PRO gene within a
CC particular tissue; treating a cardiovascular, endothelial or anglogenic
CC disorder via the administration of a PRO protein, PRO nucleic acid, or
CC PRO agonist or antagonist; a retroviral gene therapy vector comprising a
CC PRO nucleic acid; and methods of inhibiting or stimulating endothelial
CC call growth, cardiac hypertrophy or PRO-induced angiogenesis via the
CC administration of a PRO proteins, antibodies against PRO proteins, PRO
CC agonists and PRO antagonists may be used as therapeutic agents to treat
CC cardiovascular, endothelial or anglogenic disorders, such as
CC atherosclerosis, osteoporosis, myocardial infarction, hypertension,
CC disease, or stroke. PRO nucleic acids are additionally useful in the
CC recombinant production of PRO proteins, as hybridisation probes to screen
CC disease, or stroke. PRO nucleic acids are additionally useful in the
CC component and screening of potential therapeutic agents. CC useful for the development and screening of potential therapeutic agents.
CC component sequence represents a PCR primer used in the isolation of a CC cDNA encoding a PRO protein of the invention

The invention relates to synthetic oligonucleotides which are capable of inducing erythroid differentiation for the manufacture of a medicament for the therapeutic treatment of beta-thalassaemia and neoplastic diseases. The invention also relates to a pharmaceutical composition comprising at least a synthetic oligonucleotide and a pharmaceutical acceptable carrier. Synthetic oligonucleotides comprises nucleic acid sequences selected from the group consisting of human gamma-globulin gene promoter or gamma-globulin/delta-beta cluster coding nucleic acid sequence. The present DNA sequence is human gamma-delta-beta globin gene synthetic oligonucleotide. This oligonucleotide is used for inducing erythroid differentiation
                                                                                                                                                                                                                                                                                                                                                                                New oligonucleotides useful for inducing erythroid differentiation comprises human gamma-globulin or gamma-globulin/delta-beta cluster coding nucleic acid sequence.

(GENO-) GENOME THERAPEUTICS CORP.

WPI; 2001-639428/73

Isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode, useful for the prevention, diagnosis and treatment of asthma, obesity and inflammatory bowel disease.

Example 10; Page 149; 520pp; English.

The invention relates to isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode. The nucleic acids and proteins may be used in the prevention, diagnosis and treatment of diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sequences in samples and therefore which patients may be in need of crestorative therapy. The Gene 216 protein may also be used as antigens in the production of antibodies against Gene 216 and in assays to identify modulators of Gene 216 expression and activity. The anti-Gene 216 antibodies and antagonists may also be used to down regulate expression and activity. The anti-Gene 216 antibodies may also be used as diagnostic agents for detecting the presence of Gene 216 proteins in samples (e.g. by enzyme linked immunosorbant assay or ELISA). Disorders that may be prevented, diagnosed and/or treated by the above methods include, for example asthma, obesity and inflammatory bowel disease. The present sequence is that of a Gene 216 related primer used in examples of the invention. The primers are used in the hypsical mapping of the gene (ABZ72067-ABZ72088), polymorphism identifiction using single strand conformational polymorphism (SSCP) analysis (ABZ72091-ABZ72184), sequenceing (ABZ72185-ABZ72188) and genotyping (ABZ72317-ABZ72362)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    inactive proteins or to supplement the patients own production of Gene 216 proteins. Additionally, the nucleic acids may be used to produce the secreted Gene 216 protein, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid assays to detect and quantitate the presence of similar nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; GASC1; gene amplified in squamous cell carcinoma 1; cancer; chromosome 9; chromosome 9p23-24; cell differentiation; gene thera
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               nucleic acids (or vectors) and proteins may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of gene 216 by expressing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     12-JUN-2000; 2000JP-00174946.

                                                    This invention describes a novel epididymis-specific human protein HB12 which has antiinfertility and contraceptive activity. The products of the invention modulate heparin and apolipoprotein A-I binding in the epididymis and thus capacitance of sperm. The protein of the invention, also similar sequences from other animals, their derivatives and fragments, are useful for diagnosis of male infertility. Antibodies (Ab) directed against the protein and nucleic acid that encodes it, are useful for treatment of male infertility and as reversible contraceptives since they have a post-testicular site of action and do not interfere with hormone metabolism. This sequence represents a PCR primer used in the amplification of the canine epididymis-specific polynucleotide described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cell carcinoma 1). GASC1 has been located to the p23-24 region of h chromosome 9. GASC1 can be used in the diagnosis and investigation diseases with which cell differentiation and proliferation are associated, such as cancer. It can also be used in gene therapy of diseases, and screening substances for their ability to modify the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Canine; epididymis-specific protein; CE12; anticontraceptive; heparin binding; apolipoprotein sperm capacitance; male infertility; post-testi
                                                                                                                                                                                                                                                                                                                                                                                                                                Example 3;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a preventive or treating agent for diseases caused by abnormality in the Fas/Fas ligand system containing, as the active component, an antibody having a light chain subunit and a heavy chain subunit and an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has antiallergic, immunosuppressive and apoptotic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a PCR primer useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Drug for preventing or treating e.g. autoimmune disease comprises humanized anti-Fas antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; mouse; Fas/Fas ligand system; Fas; antibody; light chain; heavy chain; apoptosis; antiallergic; immunosuppressive; apoptotic;

The agent has antiallergic, immunosuppressive and apoptotic activity and is used for preventing and treating autoimmune diseases, allergy, atopy arothers. The present sequence is that of a PCR primer useful in the construction of anti-Fas antibodies of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to compositions and methods useful for the detentional and detection of polycystic kidney disease (PKD1) gene mutations. The invention also relates to primers comprising a 5' region having a sequence that selectively hybridises to a PKD1 gene sequence and optionally, to a PKD1 homologue sequence and an adjacent 3' region having a sequence that selectively hybridises to a PKD1 gene sequence and not to a PKD1 homologue sequence. Primer pairs of the invention are useful for detecting the presence or absence of a mutation in a PKD1 polymucleotide in a sample, for identifying a subject at risk for a PKD1-associated disorder such as autosomal dominant polycystic kidney disease (ADPKD) or acquired cystic disease and for diagnosing a PKD1-associated disorder in a subject. They are useful for selectively amplifying a region of a PKD1 C acquired cystic disease and for diagnosing a PKD1-associated disorder in EKD1 polymucleotide in a sample, as a probe for an amplification of a PKD1 capturely in hybridisation or amplification assays of biological samples to detect abnormalities of PKD1 expression and for engineering transgenic captured is a PKD primer usef of detect mutation in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

NOVX polypeptides and a disorder associated

polynuclectides, useful for preventing or treating with aberrant NOVX expression or activity e.g., atherosclerosis, cardiomyopathy or bronchial

hypertension,

2002-723332/78.

English

This invention describes novel human NOVX polypeptides which have cytostatic, cardiant, antiarteriosclerotic, antiasthmatic and hypotensiv cytostatic. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX expression or activity e.g. cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial

hypotensive

                                                                                                                                                                                                                                                                                The invention relates to a preventive or treating agent for diseases caused by abnormality in Fas/Fas ligand system containing as the active component an antibody having as the light chain subunit a polypeptide containing residues 1-218 of one of 3, 239 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, all fully defined in the specification and having an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has immunosuppressive and antiallergic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a PCR primer, useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; mouse; humanised anti-Fas antibody; Fas/Fas ligand; light chain subunit; apoptosis; immunosuppressive; antiallergic; autoimmune disease; allergy; atopic; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           asthma. The products of the invention can be used for gene therapy or in a vaccine. ABX13460-ABX13462 and ABX97186-ABX97593 represent PCR primers and probes used in the amplification and isolation of the NOVX polynucleotides represented in ABX97008-ABX97185 which encode the polypeptides represented in ABX97008-ABX97185

The agent has immunosuppressive and antiallargic activity and is used for preventing and treating autoimmune diseases, allergy, atopy and others. The present sequence is that of a PCR primer, useful to the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in ABQ80141-52 represent primers which were used to CC identify wild type and variant loci in the human interleukin 4 receptor CC (ILAR). These primer sequences were used in the method of the invention CC for determining an individual's risk for type 1 diabetes. The method CC comprises detecting the presence of an insulin dependent diabetes CC mellitus (IDDM)-associated interleukin 4 receptor allele in a nucleic cacid sample of the individual, where the presence of the allele indicates CC the individual's risk for type 1 diabetes. The method identifies one or CC more single nucleotide polymorphism (SNP) within the IL4R gene listed in CC the specification. The method and the SNP's are also useful for determining an individual's risk for any autoimmune disease or condition or any T helper type 1 diabetes. The IL4R SNP's are also useful for CC country T helper type 1 mediated disease, systemic lupus crythematosus, psoriasis, scleroderma, Grave's disease, systemic countries, myasthenia gravis, Guillain-Barre syndrome, or Hashimoto's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Determining an individual's risk for type 1 diabetes, comprises detecting the presence of an insulin dependent diabetes mellitus-associated interleukin 4 receptor allele in a nucleic acid sample of the individual.

                                                                                                                                                                                                                                                          cc nucleic acid sequence identity to a nucleutide sequence encoding one of cc fl secreted/transmembrane polypeptides, or PRO polypeptides or encoding a cc the PRO protein extracellular domain. Also included are a vector comprising cc the PRO nucleic acid, a host cell comprising the vector, producing a PRO cc polypeptide (by culturing the host cell for the expression of the PRO cc polypeptide, and recovering the PRO polypeptide from the cell culture), cc an isolated PRO polypeptide (having at least 80% sequence identity to: (c) an amino acid sequence selected from the 61 PRO proteins; (b) an amino cc acid sequence encoded by a nucleic acid molecule deposited with an ATCC number (detailed in the specification); or (c) an extracellular domain of a PRO polypeptide or to a PRO polypeptide lacking its associated signal peptide), a chimaeric molecule comprising a PRO polypeptide of fused to a record of containing a proteins; (b) an amino acid sequence, an anti-PRO antibody, detecting a protein and screening at least one biological activity of a cell expressing a PRO245 or PRO1868 Nucleic acids which encode PRO can be used to generate either cc development and screening of therapy. In chromosome identification, as ccids may be used in gene therapy, in chromosome identification, as ccids may also be used for recombinantly expressing those markers. The nucleic acids may be used for recombinantly expressing the isolated consecued and nucleic acids may be used for recombinantly expressing the state of the protein electrophoresis, and the isolated consecuence and nucleic acids may also be used in tissue typing.

CC affinity purification of PRO from recombinantly expressing those markers. The protein protein acids may also be used in tissue typing.

CC affinity purification of PRO from recombinant cell culture or natural consecuence is a PCR primer used to isolate a cDNA encoding a PRO protein
                                                                                                                                                                                                                                         밁

The invention describes a new isolated with the American the full length coding sequence of the DNA deposited with the American Type Culture Collection (e.g. ATCC Deposit No. 209258) or a sequence CW with at least 80% identity to a DNA encoding a PRO polypeptide comprising CC any of 61 sequences having 164-1119 amino acids fully defined in the Specification. The PRO polypeptides or polynucleotides are useful as CC pharmaceuticals, diagnostics, biosensors or bioreactors. These are CC particularly useful for detecting or treating e.g. Parkinson's disease, CC Alzheimer's disease, inflammations, nephritis, wound healing, nerve CC repair, collateral blood vessel formation, cancers (e.g. colorectal CC cancer), haemorrhage (or reduce risk for haemorrhage), rheumatoid CC arthritis, diabetes, cirrhosis of the liver, fibrosis of the lungs, CC restenosis, dermal fibrotic conditions (e.g. keloids or scarring), CC ischaemia, strokes, hypertension, heart attacks, atherosclerosis, or infertility in mammals (e.g. humans, dogs, cats, cattle, horses, sheep, pigs, goats, or rabbits) The PRO polypeptides are useful as targets for CC therapeutic intervention in these diseases, and diagnostic determination of the presence of these diseases. The PRO polypeptides are also useful cas molecular weight markers, or for chromosome identification. The PRO C genes are useful as hybridisation probes, or for screening libraries of human cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. This sequence represents a novel human secreted and transmembrane PRO polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to the isolation of novel human CC polypeptides referred to as NOVX (NOVI-NOV37), variants of these CC proteins, and the polynucleotide sequences encoding them. The NOVX proteins of the invention share homology to varies types of protein CC lipoproteins. The sequences of the invention may be useful in the CC manufacture of a medicament for treating a syndrome associated with a CC human disease. For example they can be used to treat inflammatory CC disorders, demyelination disease, renal disorders, infections, CC cardiomyopathy, atherosclerosis, hypertension, stroke, pancreatitis, Von CC hippel-Lindau, endometriosis, fertility, scleroderma, cirrhosis, CC diseases, allergies, graft versus host disease, haemophilia, autoimmune CC diseases, allergies, graft versus host disease, haemophilia, autoimmune CC arthritis, Parkinson's disease, Huntington's disease, obesity, diabetes, acne, hair growth/loss, asthma, schizophrenia, AIDS, pain, CC acne, hair growth/loss, asthma, schizophrenia, AIDS, pain, CC arthritis, lupus erythematosus, and psoriasis. The present CC invention. Note: SEQ ID Nos 113-460 are known sequences used for homology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                           δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated PRO polypeptide having at least 80% CC amino acid sequence identity to: (a) any one of 61 fully defined amino acid sequences given in the specification (appearing as ABU54347-CC ABU54407); (b) an amino acid sequence encoded by the nucleotide sequence CC deposited under American Type Culture Collection (accession numbers CC listed in the specification); (c) any one of the PRO sequences which lacks its associated signal peptide; (d) an extracellular domain of the PRO polypeptide with its associated signal peptide; or (e) an CC extracellular domain of the PRO polypeptide. Also include are the nucleic acids encoding the PRO CC signal peptides, vectors, host cells and anti-PRO antibodies. The PRO CC polypeptides and nucleic acids are useful in diagnosing or treating CC enterpocolitis, gastrointestinal ulceration, e.g. psoriasis or epithelial CC cancers such as squamous cell carcinoma, Alzheimer's diseases associated with CC cancers such as squamous cell carcinoma, Alzheimer's disease, Parkinson's CC issuese, amyotrophic lateral sclerosis, inflammatory diseases, Parkinson's CC atherosclerosis, carcer, diabetic complications, or mutations in general. The CC aging, AIDS, cancer, diabetic complications, or mutations in general. The CC concerned with re-growth of tissue. The nucleotide sequences may be used on any bridisation probes in chromosome and gene manning or in cenarating concerned with re-growth of tissue. The nucleotide sequences may be used
                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                              as hybridisation probes in chromosome and gene mapping, or in generating antisense RNA and DNA. PRO nucleic acids are also useful in preparing PRO polypeptides, in assays to identify other proteins or molecules involved in binding reaction, to generate transgenic animals or knockout animals, which in turn are useful in the development and screening of therapeutically useful reagents, for chromosome identification, and tissue typing. The PRO polypeptides and nucleic acid molecules are also useful in gene therapy, and as molecular weight markers for protein electrophoresis purposes. The anti-PRO antibodies may be used in diagnostic assays for PRO, or for the affinity purification of PRO from recombinant cell culture or natural sources. The present sequence is a PCR primer used to isolate a cDNA encoding a PRO polypeptide
Human secreted/transmembrane polypeptide PRO328 forward primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New PRO polypeptides and nucleic acid molecules, useful in diagnosing or treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, cancer, AIDS, Alzheimer's disease or Parkinson's

```
The invention relates to an isolated PRO polypeptide. PRO317 is useful in CC diagnosing or treating abnormal bleeding involved in gynecological CC diseases e.g. to avoid or lessen the need for hysterectomy. PRO317 may CC also be useful as an agent that affects angiogenesis and PRO317 is useful CC in anti-tumour indications or in treating coronary ischaemic conditions. CC PRO211 and PRO217 polypeptides are useful for treating disorders CC associated with the preservation and maintenance of gastrointestinal CC mucosa and the repair of acute and chronic mucosal lesions, skin diseases CC associated with abnormal keratinocyte differentiation (e.g. psoriasis). PRO187 polypeptide is useful for treating Parkinson's disease. CC Alzheimer's disease, amyotrophic lateral sclerosis (ALS), neuropathies CC and disease related to uncontrolled call growth, e.g. cancer. PRO219 CC polypeptide plays a regulatory role in the blood coagulation cascade. CC PRO246 polypeptides which serves as tumour specific antigens may be collypeptide is useful as an antithrombotic agent with reduced risk for CC caploited as therapeutic targets for anti-tumour drugs. PRO269 CC exploited is useful as an antithrombotic agent with reduced risk for treating endometrial bleeding angiogenesis. PRO287 polypeptides and coagulation cascade relating endometrial bleeding angiogenesis. PRO287 polypeptides and creating endometrial bleeding angiogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pilvaroff E, Pong S, Gao W, Godowski PJ, Grimaldi JC, Gur Mather JP, Pan J, Paoni NF, Williams PM, Wood WI:

                                                                                                                                                                                                                                                                                                                                            psoriasis and multiple sclerosis. The polypeptide and its nucleic acid are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of PRO from recombinant cell culture or natural sources.
Human gene 216 polymorphism detection PCR primer #86.

New isolated gene 216 nucleic acids, useful for diagnosing, preventing treating a disorder, such as asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease, obesity or inflammatory bowel ö

Example 10; Page 155; 650pp; English.

preventing or treating a disorder, such as respiratory diseases asthma, bronchial hyper-responsiveness, chronic obstructive pulm disease or adult respiratory distress syndrome), obesity, or inf This invention relates to a novel isolated nucleic acid, gene 216, identified from human chromosome 20p13-p12. The invention also discloses regions of the 216 gene that contain single nucleotide polymorphisms (SNP's) which may be used as markers for disease susceptibility or severity. The nucleotides of the invention may have antiasthmatic, antiinflammatory or anorectic activities and may be used in gene therapy. The nucleic acids, antibodies or its fragments are useful for diagnosing, pulmonary inflammatory ê

The nucleic acids are also useful for identifying increased susceptibility of a subject to the disorders mentioned. The nucleic acids can also be used as primers and templates for the recombinant production of disorder-associated peptides or polypeptides, for chromosome and gene mapping, or for tissue distribution studies. The present sequence represents a gene 216 specific PCR primer used in the scope of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         31-OCT-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antiinflammatory.

New secreted and transmembrane PRO polypeptides (e.g. PRO533 or PRO245) and genes encoding them, useful for detecting or treating e.g. hyperplasia, endometriosis, cancers, ischemia, coronary arterial diseas or inflammations. disease

Example 42; Page 112; 477pp; English

The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating raise

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       at least one biological activity of a cell. The PRO polypeptides or polynucleotides are also useful as pharmaceuticals, diagnostics, biosensors or bioreactors, for detecting or treating e.g. hyperplasia, endometriosis, cancers (e.g. those involving solid tumours), ischaemia, coronary arterial disease, polycystic kidney disease, chronic or acute renal failure, or inflammatory responses (e.g. asthma, rheumatoid arthritis, psoriasis or multiple sclerosis) in mammals. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequences presented in ABY96017-ABX96378 are the genes encoding, the primers amplifying and the probes detecting the PRO polynucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; gene therapy; mucosal lesion; ulcer; enterocolitis; skin disease; psoriasis; cancer; lung cancer; colon cancer; nerve cell disease; Alzheimer's disease; Parkinson's disease; Usher syndrome; anglogenesis; atrophia areata; inflammatory disease; asthma; rheumatoid arthritis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        $
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to sixty one nucleic acids encoding PRO college (secreted and transmembrane). The polypucheotide is useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy. The polynucleotide may also be used in preparing PRO polypeptides by recombinant techniques, and in generating either transgenic animals or knock-out animals which, in turn, are useful in the development and screening of therapeutically useful reagents. The PRO polypeptide or the antibody is used in preparing a medicament for treating a condition responsive to the polypeptide or antibody, such as mucosal lesions e.g. ulcers and enterocolitis, skin disease e.g. psoriasis, cancer e.g. lung cancer and colon cancer, nerve cell disease e.g. Alzheimer's disease and Parkinson's disease e.g asthma and crophia areata, angiogenesis, inflammatory disease e.g asthma and crophia areata, angiogenesis, inflammatory disease e.g asthma and color cancer in the present sequence represents an PCR primer used in isolating a PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                         ঠ
                                                                                                                                                                                                                                                CC polypeptide, termed PRO polypeptide. The polypeptide is useful for contentifying agonists or antagonists of the polypeptide, for preparing contentifying agonists or antagonists of the polypeptide is useful for celectrophoresis purpose and the nucleic acid is useful for recombinantly capenic probes in the polypeptide is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding interaction. The nucleic acid is useful as continuously interaction. The nucleic acid is useful as continuously interaction of probes for mapping, in generation of continuously in the development and screening of therapeutically useful as creating transgenic animals or knockout animals which in turn are useful in the development and screening of therapeutically useful concides the PRO and for the genetic analysis of individuals with genetic conditions, in gene therapy, for chromosome identification, as chromosome marker, and for generating probes for polymerase chain reaction (PCR), construct hybridisation probes for mapping the gene which construct hybridisation probes for polymerase chain reaction (PCR), construct hybridisation and western analysis. PRO antibody is useful for the preparation of medicament reaction in specific cells, tissues or serum and for affinity purification of PRO conditions which is responsive to the PRO polypeptide or anti-PRO conditions which is responsive to the PRO polypeptide or anti-PRO conditions which is responsive to the PRO polypeptide or anti-PRO conditions which is responsive to the PRO polypeptide or anti-PRO conditions which is responsive to the PRO polypeptide or anti-PRO conditions which is responsive to the PRO polypeptide or anti-PRO conditions which is responsive to the PRO polypeptide or anti-PRO conditions which is responsive to the PRO polypeptide or anti-PRO conditions which is responsive to the PRO polypeptide or anti-PRO conditions which is responsive to the PRO polypeptide or anti-PRO conditions of the proper conditions of the 
                                                                                                                                                                                     Query Match

treating PRO polypeptides and nucleic acid molecules, useful in diagnosing or ating inflammatory diseases, organ failure, atherosclerosis, cardiac ury, infertility, cancer, AIDS, Alzheimer's disease or Parkinson's

Example 42; Page 106; 473pp; English.

(secreted and transmembrane). The PRO polypeptides and nucleic acids are cuesful in diagnosing or treating entercoclitis, gastrointestinal culceration, skin diseases associated with abnormal keratinocyte differentiation, e.g. psoriasis or epithelial cancers such as squamous cell carcinoma, Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, inflammatory disease, e.g. rheumatoid arthritis, asthma or multiple sclerosis, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, calbo useful for wound repair and associated therapies concerned with recombined to stissue. The PRO polypeptides and nucleic acid molecules are also useful in gene therapy, and as molecular weight markers for protein celectrophoresis purposes. The anti-PRO antibodies may be used in clasmostic assays for PRO, or for the affinity purification of PRO from recombinant cell culture or natural sources. This sequence represents a novel human PRO polypeptide associated primer describes sixty one nucleic acids encoding PRO polypeptides des and nucleic acids are

                                                                                                                                                                                                                                                     The present invention relates to an immortalized cell line of epididymal origin produced by immortalizing primary cultures of mammalian epididymal cells. The cells are useful for identifying agents that increase or reduce male fertility (potentially useful for treating infertility or as a contraceptives) and to assess their cytotoxicity, analysing the function of the epididymis and assessing activity of a promoter (by expressing a gene controlled by it in the cells. They can also be used in co-cultures with sperm, in serum-free medium, for maturation of the sperm. The present sequence is a PCR primer used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 19

Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating abnormal bleeding involved in gynecological diseases, skin diseases and neurodegenerative diseases.

## Example 42; Page 106; 467pp; English.

The invention relates to an isolated secreted and transmembrane PRO colypeptide. The PRO polypeptides are useful for modulating biological cativity of a cell, in diagnosing or treating abnormal bleeding involved in gynaecological diseases e.g. to avoid or lessen the need for condition, disorders associated with the preservation and maintenance of condition, disorders associated with the preservation and maintenance of condition, disorders associated with the preservation and maintenance of conditions, skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis), Parkinson's disease, Alzheimer's consease, amyotrophic lateral sclerosis (ALS), neuropathies, disease condenserval bleeding, wound healing, tissue repair, setuma, rheumatoid cathritis, multiple sclerosis, Nucleic acid encoding PRO polypeptides are useful in molecular biology including uses as hybridisation probes and in the generation of antisense RNA and DNA, for preparing PRO polypeptides, des are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   for generating transgenic animals or knockout animals. The PRO polypeptides and their nucleic acids are useful for tissue typing. PRO antibodies are useful for munchastochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum for affinity purification of PRO from recombinant cell culture or natu sources. The present sequence represents a human secreted and transmembrane PRO polypeptide PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human

can the invention discloses isolated PRO secreted/transmembrane polypeptides can the nucleic acid encoding them. The polypeptides can be used to raise call antibodies that specifically bind to the PRO polypeptide, for linking a chicactive molecule to a cell expressing a PRO polypeptide are useful cor a cell expressing a PRO polypeptide are useful cor a cell expressing a PRO polypeptides are useful for modulating the total cell expressing a PRO polypeptides are useful for treating disorders associated with the preservation and maintenance of gastroinfestinal mucosa and the repair of acute and chronic mucosal for treating of the PRO polypeptides in a sample and for linking a conferentiation (e.g. peoriasis), Parkinson's disease, Alzheimer's diseases, amyotrophic lateral sclerosis (ALS), neuropathies and canditionally, disease related to uncontrolled cell growth, e.g. cancer capital canditionally, disease related to uncontrolled cell growth, e.g. cancer exploited as therapeutically in vivo for lessening the effects of viral ciffic infection. The PRO polypeptides can be also used in assays to determine the properties and therapeutically in vivo for lessening the effects of viral ciffic infection. The PRO polypeptides can be also used in assays to determine the properties of the parith, in treating other PRO-associated disorders, and are also canditionally in the properties of any properties as compared with reduced risk for hemorrhage as compared with conditionally in the properties. The polymuclectides are useful in conditating uses as hybridisation probes for conditionally considered with properties. The polymuclectides are useful in the development and screening of the properties, for generating transgenic animals or therepared with properties and for characteristic animals or conditionally useful research and properties and for the genetic analysis of individuals with genetic disorders as well as for recombinantly correcting transpender animals or conditionally conditionally as a conditional properties are usef
